(54) Title: DISPLAY MANAGEMENT FOR HIGH DYNAMIC RANGE VIDEO

(51) Int.Cl.2016.01: H 04N 1/60, H 04N 9/68, G 06T 5/00

(57) Abstract: A display management processor receives an input image with enhanced dynamic range to be displayed on a target display which has a different dynamic range than a reference display. The input image is first transformed into a perceptually-quantized (PQ) color space, preferably the IPT-PQ color space. A color volume mapping function, which includes an adaptive tone-mapping function and an adaptive gamut mapping function, generates a mapped image. A detail-preservation step is applied to the intensity component of the mapped image to generate a final mapped image with a filtered tone-mapped intensity image. The final mapped image is then translated back to the display's preferred color space. Examples of the adaptive tone mapping and gamut mapping functions are provided.

(54) Title: ETHANOL PRODUCTION DEVICE AND PROCESS THROUGH CONTINUOUS SOLID-STATE FERMENTATION AND HAVING SELF-CONTROL SYSTEM

(51) Int.Cl.2016.01: C 12P 7/06

(57) Abstract: The present invention belongs to the technical field of fuel ethanol production through microorganism fermentation, and specifically relates to an ethanol production device through continuous solid fermentation and having a self-control system and a process thereof. The process mainly comprises two steps, namely, bacteria addition and continuous solid fermentation, that is, adding fermentation bacteria into pulverized raw materials, when the pulverized raw materials enter into a continuous solid fermentation tank; and then allowing the raw materials mixed with fermentation bacteria to experience fermentation in the continuous solid fermentation tank, so as to convert fermentable sugars into ethanol. In the present invention, continuous solid fermentation is used, so that fermentable sugars in straws is fully used, usage of antiseptic is avoided, high energy consumption required by straw squeezing is saved, a large amount of sewage discharge is reduced, thereby improving production efficiency and yield and saving production costs. In addition, a self-control continuous solid fermentation device is used, so that a conventional production mode is changed, the continuation and automation of a solid fermentation process

is really implemented. A revolution speed of a fermentation tank body and an angle of a cloth plate are adjustable, thereby strengthening adjustability and controllability of production.

(51) Int.Cl.2016.01: E 03D 11/00, E 03D 11/10, A 47K 11/02

(57) Abstract: The invention described herein includes a latrine pan and collector system for use in an offset pit latrine. The system permits use of a latrine pan having a flapper in an offset leach pit context, and eliminated the necessity of large scale installation of a concrete collection box, which can collect unsanitary debris. The system of the invention includes (1) a pour-flush latrine pan and (2) a collector. The collector includes a collector body that engages the latrine pan, defines a discharge opening, and secures an inclined surface sloping downwardly between an impact zone positioned beneath the outlet of the latrine pan and the discharge opening, the collector body securing the inclined surface at a position sufficiently distant from the underside of the latrine pan so that the inclined surface does not impede pivoting of the flapper, whereby material discharged from the outlet of the latrine pan contacts the inclined surface at the impact zone and slides downwardly from the impact zone to the discharge opening. Also included is the collector described above, related latrine structures and methods.

(51) Int.Cl.2016.01: C 10G 7/02, C 10G 5/06

(57) Abstract: A mixed phase pressurized unstabilized hydrocarbon stream is fed into a stabilizer column at a feed pressure. A liquid phase of stabilized hydrocarbon condensate is discharged from a bottom end of the stabilizer column, while a vapour phase of volatile components from the pressurized unstabilized hydrocarbon condensate stream is discharged from a top end of the stabilizer column. The vapour phase being discharged from the top end of the stabilizer column is compressed and subsequently passed through an ambient heat exchanger wherein partial condensation takes place. The resulting partially condensed overhead stream is separated in an overhead separator into a vapour effluent stream and an overhead liquid stream. After discharging the overhead liquid stream from the overhead separator, it is selectively divided into a liquid reflux stream and a liquid effluent stream. The liquid reflux stream is expanded to the feed pressure and fed into the stabilizer column.

(54) Title: VALVE FOR A TAP OR FAUCET

(51) Int.Cl.2016.01: F 16D 7/04, F 16K 31/50

(57) Abstract: A lift valve or tap is actuated by a non-rising spindle (12). The spindle (12) comprises a sleeve (20) and a shaft (22) coaxially mounted in the sleeve (20). The lower portion of the shaft (22) is threaded (23) and engages a closing member (18). Upon rotation of the spindle (12) the closing member (18) opens or closes the valve. Closing member (18) carries a seal (19) cooperating with a valve seat (42). To prevent excessive torque on the closing member (18) in the fully open and fully closed position of the valve, a torque-limiting device (24, 26, 28) is arranged between the lower end of the sleeve (20) and the threaded part (23) of the shaft (22). The torque-limiting device comprises a compressible washer (26), a first corrugated disk (24) and a second corrugated disk (28). The compressible washer (26) is positioned between the base of the shaft (22) and the upper corrugated disk (24). The lower corrugated disk (28) is located on the shaft (22) and cooperates with the upper corrugated disk (24). If the torque applied to the sleeve (20) via handle (40) reaches a predefined level, first (24) and second (28) corrugated disks rotate relative to one another similar to a ratchet-type clutch and an excessive torque on the closing member (18), seal (19) and valve seat (42) is prevented. As a second means for limiting torque, the closing member (18) is shaped to rotate within the valve housing (14) when subjected to a predefined rotational torque. For this purpose the bore of the housing (14) is of non-circular cross-section allowing slip between housing (14) and closing member (18) above a predefined torque. Preferably the shaft (22), the closing member (18) and the housing (14) are made of plastic, for example ABS, PVC or polypropylene.

(57) Abstract: A floatable turbine (10) is described, which is movable on a substantially vertically oriented guide (20) so that the turbine (10) may move downwards along the guide (20) under gravitational force. The turbine equipment (10) is of negative buoyancy to facilitate it sinking, but is further provided with adjustable buoyancy means to allow the turbine arrangement to be imparted with a positive buoyancy when required. When imparted with a positive buoyancy the turbine equipment (10) floats back up the vertically oriented guide (20) under the buoyancy force. When moving down the guide (20) under gravity, and back up the guide (20) under buoyancy force an effective artificial current is generated by the movement through the turbine blades, turning the blades which in turn cause a generator to produce electricity, typically by suitable gearing.

(57) Abstract: The present invention provides an engine unit that can, without an increase in size of a generator, secure an amount of electricity generation at a high efficiency even if the rotational velocity of a crankshaft is decreased during a vehicle stoppage. The engine unit is provided with: a four-stroke engine body; a generator that outputs a voltage lower than the voltage of a battery provided to the vehicle when the crankshaft is rotating at the rotational velocity of idling rotation; an inverter provided with a plurality of switching units; and a control device. During at least a portion of the period during which the vehicle is stopped and the voltage output by the generator is lower than the battery voltage, the control device performs vector control of the plurality of switching units provided to the inverter, thereby increasing the voltage that is lower than the voltage of the battery output by the generator to a voltage higher than the voltage of the battery, and thus charging the battery.

The clamp ring elements are divided into mutually opposed groups that are interdigitated such that the clamp ring elements alternate from one group to the other around the circumference of the clamp ring. A longitudinally-acting actuator System drives relative longitudinal movement of the groups to effect clamping expansion of the clamp ring by wedging interaction between the circumferentially-alternating clamp ring elements of the groups. By expanding the clamp ring in alignment with a weld plane between the abutting ends, the same clamp ring may be used to align the pipe lengths and to back a weld between them.

(57) Abstract: The present invention provides: an engine unit and the like that has a high-load region and a low-load region, and can suppress unevenness in the position at which the rotation of a crankshaft halts after halting combustion of a four-stroke engine body. The engine unit is provided with: a four-stroke engine body having a high-load region and a low-load region; a three-phase brushless motor that starts the four-stroke engine body and that generates electricity after the startup of the four-stroke engine body; an inverter having a plurality of switching units; and a control device. After halting the combustion operation of the four-stroke engine body and while the crankshaft is performing positive rotation, the control device controls the plurality of switching elements in a manner so that the terminals of a plurality of coils are short-circuited, thus imparting resistance to the positive rotation of the crankshaft, and thereby halting the positive rotation of the crankshaft during the compression stroke of the four-stroke engine body.

(54) MAKING OF ALCOHOLIC BEVERAGES FROM DATE PALM FRUIT
(57)

The present invention provides a method of making alcoholic beverages from date palm fruit (*Phoenix dactylifera*). Dry date palm fruits are processed to produce the alcoholic beverages as explained here in. Processing of the dry date fruit involved, removing of the seed and the perianth (the floral structure comprised of the calyx/sepal and corolla/petals especially when the two whorls are fused). The pitted dry palm date fruits are put in boiling water for approximately two minutes to pastualize. The pastualized date palm fruit it then allowed to cool. The cooled pastualized date palm fruit is then transferred to fermenting chamber. Distilled water is added up to three quarters of the chamber containing the date palm fruit. The ratio of dates to water is keenly observed to obtain the desired alcoholic beverage with varying taste, flavor and aroma. Table sugar dissolved in distilled water is added to the chamber. This is to aid in fermentation and also aid in achieving desired level of alcohol. Wine yeast (*saccharomyces cerevisiae*) is

then added to the chamber. The chamber is coved in such a way to allow controlled circulation of air in and out the chamber. Date palm fruits are fermented for about seven to fourteen days. The content is then drained to obtain the date fruit alcoholic beverage with beer, cider and wine tastes. The alcoholic beverage obtained is decanted, filtered and clarified to remove yeast traces and residue proteins present. The resulting date fruit alcoholic beverage is golden in colour, with excellent beer, cider or wine aroma and taste. The alcoholic beverage obtained has alcohol content of up to 15%. This alcoholic beverage is uniquely excellent and can widely be accepted commercially hence making it an excellent alternative to other alcoholic beverages obtained from grape (wine), cider (apple) or beer (grain). The alcoholic beverage produced using this method may be distilled to make a neutral spirit (brandy). This neutral spirit may be treated with dairy or nondairy cream to make a unique date fruit cream liquor. Further, the alcoholic beverage obtained using the method explained may be given a second fermentation to get sparkling date fruit alcoholic beverage.

11.4 Removals

Section 23 of the Trade Marks Act provides that registration of a trade mark in Kenya shall expire after a period of **ten (10) years**. The Act also provides that the proprietor of a registered trade mark may make an application for renewal of the trade mark upon completion of the prescribed Form TM 10 and payment of the prescribed renewal fee.

Rule 65 of the Trade Mark Rules provides that where no application for renewal of a registered trade mark is received upon expiry of the ten year period, the Registrar of Trade Marks shall notify the proprietor of this fact. Where no application for renewal of the registered trade mark is received within a period of **sixty (60) days** from the date of the notice for renewal by the Registrar, rule 67 of the Trade Mark Rules requires the Registrar of Trade Marks to publish this fact.

In accordance with the above provisions, the Registrar of Trade Marks hereby notifies the public that the proprietors of the trade marks indicated below were duly notified and that they did not file applications for renewal of their respective trade marks.

In accordance with the provisions of rules 67 and 68 of the Trade Mark Rules, the public is hereby notified as follows:

- (a) Where the proprietor of a registered trade mark makes an application for renewal of a mark that has been published herein and pays the renewal fee together with the additional prescribed late renewal fee **within thirty (30) days** from the date of this publication, the trade mark shall be renewed and shall not be removed from the Register of Trade Marks;
- (b) Where no application for renewal of a trade mark published herein is received **within thirty (30) days** from the date of this publication, the trade mark shall be forthwith removed from the Register of Trade Marks; and

Once the trade mark is removed from the Register of Trade Marks, the proprietor may thereafter make an application for renewal of the mark upon payment of the prescribed renewal fee together with the additional prescribed restoration fee. The trade mark shall then be restored to the Register of Trade Marks upon the Registrar of Trade Marks being satisfied that it is just to do so and upon imposing such conditions as the Registrar may deem fit.
