A bioethanol product derived from water hyacinth (*Eichhornia crassipes*), comprising 85% ethanol, 10% methanol, 2% acetic acid and 3% trace compounds is disclosed. The invention further discloses a process involving collection of water hyacinth plant, cleaning, chopping, blending into slurry, filtering and storing it at about 15°C. The process involves simple sterilization pretreatment and dilute acid pretreatment steps, neutralization using sodium hydroxide and detoxification using calcium hydroxide. The medium is hydrolyzed using *Aspergillus niger* fungus before being inoculated in the pretreated fermentation medium and subcultured on the second day to test for its viability. Fermentation is done using *Saccharomyces cerevisiae* yeast which is inoculated into the fermentation medium in an oxygen incubator for 5 days. The resultant fermentation broth is filtered. The filtrate is subjected to Soxhlet distillation to obtain a 22.78% bioethanol distillate which is analyzed using Gas Chromatography - Mass spectrometry to ascertain its composition and purity.

Since, higher volume of water is employed during various unit processes, the discharge of effluent correspondingly increase with the pollutants. The present invention relates to avoiding the use of water for pickle-basification free chrome tanning process. Auxiliary chemicals like fatliquors are used to enhance the exhaustion of chromium during tanning process. Moreover, the use of salt and the basification process are avoided in the new process. The organoleptic and strength properties of the tanned leathers are on par with conventionally processed leathers. This new invention makes an effort to utilize the inherent water in the skin for tanning so as to attain sustainability with reduced pollution loads.

The CNS receives communication information from a calling party device (CGPD) or a network thereof, when an unsuccessful communication attempt is made by the CGPD to contact a called party device (CDPD), and places a call to the destination number with an identification of an originator of the call as the source number using the communication information. The CNS identifies a ring of the CDPD when the call successfully reaches the destination number and terminates the call before chargeable completion of the call, thereby sending an MCRA from the source number of the CGPD to the destination number of the CDPD. The CNS sends one or more alternative callback notifications to the destination number, concurrently with the MCRA or if the MCRA is unsuccessful.

(57) Abstract: Techniques for end-to-end beamforming in a wireless communication system using access node clusters that are distinct from a user coverage area are described. Forward link end-to-end beamforming may involve multiple access nodes in one or more access node clusters transmitting signals that, when relayed by multiple transmit/receive signals paths within an end-to-end-relay, form user beams in the user coverage area. Return link end-to-end beamforming includes applying beamforming weights to signals transmitted by user terminals and relayed by multiple transmit/receive signals paths in the end-to-end relay to the access nodes to form return beam signals associated with return user beams. The access node clusters may overlap or be outside the user coverage area, and multiple access node clusters may serve one or more user coverage areas selectively or concurrently. Multiple feeder-link frequency bands may be employed by the same or different access node clusters.

(54) Title: Microfluid Chip-Based, Universal Coagulation Assay

(51) Int.Cl.2016.01: B 01L 3/00, G 01N 33/49

(57) Abstract: A microfluidic, chip-based assay device has been developed for measuring physical properties of an analyte (particularly, whole blood or whole blood derivatives). The technologies can be applied to measure clotting times of whole blood or blood derivatives, determine the effects of anticoagulant drugs on

the kinetics of clotting/coagulation, as well as evaluate the effect of anticoagulant reversal agents. These technologies can additionally be used to optimize the dosage of anticoagulation drugs and/or their reversal agents. The assay is independent of the presence of anticoagulant; clotting is activated by exposure of the blood sample in the device to a glass (or other negatively charged material such as oxidized silicon) surface, which activates the intrinsic pathway and can be further hastened by the application of shear flow across the activating materials surface. The absence of chemical activating agents and highly controlled and reproducible micro-environment yields a point of care universal clotting assay.

 (57) Abstract: Magnetic resonance (MR) apparatuses, systems and methods for analysing a material. The magnetic resonance apparatuses include a primary loop defining an aperture that the material being analysed can pass through where the primary loop includes at least one pair of 5 electrically conductive segments. The magnetic resonance apparatus also includes a pair of capacitance units corresponding to each pair of electrically conductive segments. Each capacitance unit is conductively connected to two adjoining conductive segments in series so that the primary loop forms a circuit for a radio frequency (RF) current. The primary loop is adapted to: conduct the RF electrical current so that the RF electrical current is predominantly 10 in-phase over the entire primary loop. The magnetic resonance apparatus further includes: a pair of secondary coils corresponding to each pair of capacitor units, electrically conductively isolated from the primary loop. Each secondary coil is oriented to be magnetically coupled to the primary loop such that each secondary coil is capable of exciting RF voltages in the primary loop that are predominantly in-phase with each of the RF voltages excited by the 15 other secondary coils. The magnetic resonance apparatus also includes a primary shield encompassing the primary loop and secondary coils for

shielding electromagnetic radiation, the primary shield adapted to allow the material to pass through the aperture defined by the primary loop unobstructed.

(51) Int.Cl.2016.01: D 01F 6/40, D 01F 6/54, A 41G 3/00

(57) Abstract: The present invention relates to modacrylic fibers for artificial hair made from a modacrylic polymer. The modacrylic polymer contains 29.5 to 79.5% by mass of acrylonitrile, 20 to 70% by mass of vinyl chloride and/or vinylidene chloride, and 0.5 to 5% by mass of a sulfonic acid group-containing vinyl monomer with respect to a total mass of the modacrylic polymer. The modacrylic fibers for artificial hair contain a condensed phosphate, and a content of the condensed phosphate in the modacrylic fibers for artificial hair is 0.05 to 0.57% by mass. Thus, the present invention provides modacrylic fibers for artificial hair that are made from a modacrylic polymer prepared by copolymerizing acrylonitrile and vinyl chloride and/or 10 vinylidene chloride, that have good texture and gloss, and that reduce the generation of odorous components during heating, a method for producing the same, and hair ornament products including the same.

(51) Int.Cl.2016.01: H 03M 7/42, H 04N 7/50, H 04N 7/26

(57) Abstract: A decoder for decoding a video from a data stream into which horizontal and vertical components of motion vector differences are coded using binarizations of the horizontal and vertical components is described, the binarizations equaling a truncated unary code of the horizontal and vertical components, respectively, within a first interval of the domain of the horizontal and vertical components below a cutoff value, and a combination of a prefix in form of the truncated unary code for the cutoff value and a suffix in form of a Exp-Golomb code of the horizontal and vertical components, respectively, within a second interval of the domain of the horizontal and vertical components inclusive and above the cutoff value, wherein the cutoff value is two and the Exp-Golomb code has order one. An entropy decoder is configured to, for the horizontal and vertical components of the motion vector differences, derive the truncated unary code from the data stream using context- adaptive binary entropy decoding with exactly one context per bin position of the truncated unary code, which is common for the horizontal and vertical components of the motion vector differences, and the Exp-Golomb code using a constant equi-probability bypass mode to obtain the binarizations of the motion vector differences. A desymbolizer is configured to debinarize the binarizations of the motion vector difference syntax elements to obtain integer values of the horizontal and vertical components of the motion vector differences; A reconstructor is configured to reconstruct the video based on the integer values of the horizontal and vertical components of the motion vector differences.

A block segmentation unit (101) recursively segments the image into rectangles of a predetermined size to generate a block subject to encoding. A bitstream generation unit (105) encodes block segmentation information of the block subject to encoding. The block segmentation unit (101) includes: a quartering unit that quarters a target block in recursive segmentation in a horizontal direction and a vertical direction to generate four blocks; and a halving unit that halves a target block in recursive segmentation in a horizontal or vertical direction to generate two blocks. When previous recursive segmentation is halving, the halving unit prohibits a target block subject to current recursive segmentation from being segmented in the same direction as a direction in which the block was segmented in the previous recursive segmentation.

(54) Title: DEWATERING TANK

(51) Int.Cl.2016.01: C 02F 11/12, B 10D 21/02

(57) Abstract: The present disclosure provides a dewatering tank that is configured to retain fines in suspension. The tank comprises a floor portion that has a downward inclination. The tank further comprises a sump that is located such that the floor portion inclines towards the sump. The tank has an inlet for admission of water containing the fines and an outlet that is adapted for connection with a pump to discharge the water containing the fines from the tank and that is located in the sump. The tank is arranged such that the water flows from the inlet to the outlet. The tank comprises a wall or cover portion that is positioned to divert a flow of the water away from a direct flow direction from the inlet to the outlet in a manner such that turbulences are induced and fines that may otherwise settle in the sump and on the floor portion are suspended.

9.4 Removals

Section 23 of the Trade Marks Act provides that registration of a trade mark in Kenya shall expire after a period of **ten (10) years**. The Act also provides that the proprietor of a registered trade mark may make an application for renewal of the trade mark upon completion of the prescribed Form TM 10 and payment of the prescribed renewal fee.

Rule 65 of the Trade Mark Rules provides that where no application for renewal of a registered trade mark is received upon expiry of the ten year period, the Registrar of Trade Marks shall notify the proprietor of this fact. Where no application for renewal of the registered trade mark is received within a period of **sixty (60) days** from the date of the notice for renewal by the Registrar, rule 67 of the Trade Mark Rules requires the Registrar of Trade Marks to publish this fact.

In accordance with the above provisions, the Registrar of Trade Marks hereby notifies the public that the proprietors of the trade marks indicated below were duly notified and that they did not file applications for renewal of their respective trade marks.

In accordance with the provisions of rules 67 and 68 of the Trade Mark Rules, the public is hereby notified as follows:

- (a) Where the proprietor of a registered trade mark makes an application for renewal of a mark that has been published herein and pays the renewal fee together with the additional prescribed late renewal fee **within thirty (30) days** from the date of this publication, the trade mark shall be renewed and shall not

be removed from the Register of Trade Marks;

- (b) Where no application for renewal of a trade mark published herein is received **within thirty (30) days** from the date of this publication, the trade mark shall be forthwith removed from the Register of Trade Marks; and

Once the trade mark is removed from the Register of Trade Marks, the proprietor may thereafter make an application for renewal of the mark upon payment of the prescribed renewal fee together with the additional prescribed restoration fee. The trade mark shall then be restored to the Register of Trade Marks upon the Registrar of Trade Marks being satisfied that it is just to do so and upon imposing such conditions as the Registrar may deem fit.
